

LMCS software is used for designing DLM systems as well as configuring and troubleshooting them. Whether the project goal is implementing code compliance or more advanced lighting applications, LMCS features tools that help specifying engineers to make system and product decisions. LMCS also provides documentation and software tools that help technicians on site to manage and program actual DLM networks and devices.

Features & Benefits

Design DLM systems and export a full suite of documentation including riser diagrams, room wiring details, sequence of operations and bills of material

Configure wired, wireless, or hybrid DLM rooms, floors, and buildings

Set and modify device parameters to meet code and enhance the user experience

Full set of reports provides details and summary of rooms and DLM networks

Manage standard DLM loads, relay panels and HCL dimming systems
